## ***Introduction***

This document presents the tests performed to characterize and validate the “HAM-ISI LHO Unit #3”.

In the first section, *Pre-Assembly Testing*, we summarize the measurements done on the capacitive position sensors, GS13 seismometers and actuators prior the beginning of the assembly.

In the second section, we present the results of the *Tests to be performed during assembly*. It includes subassemblies flatness check, the blade spring profile, the leveling of stage 0 and the lockers adjustments.

In the third section we present the *Tests to be performed after assembly*. These tests allow to check step by step the overall assembly. Transfer functions are measured and damping loops are implemented

Section four summarizes major issues during testing.

The procedure document used to perform this test is:

- E1000309 –V4 - aLIGO HAM-ISI, Pre-Integration Testing Procedure, Phase I (post assembly, before storage)

Other useful information can be found in:

- E1000300 - HAM-ISI LLO test stand: software and electronic check

**Problems encountered during transfer function measurements have not been investigated due to the possible disassembly of HAM-ISI LHO Unit #3.**
