

Explore demodulation phase for DDM on 40m RSE prototype

Osamu Miyakawa, Caltech

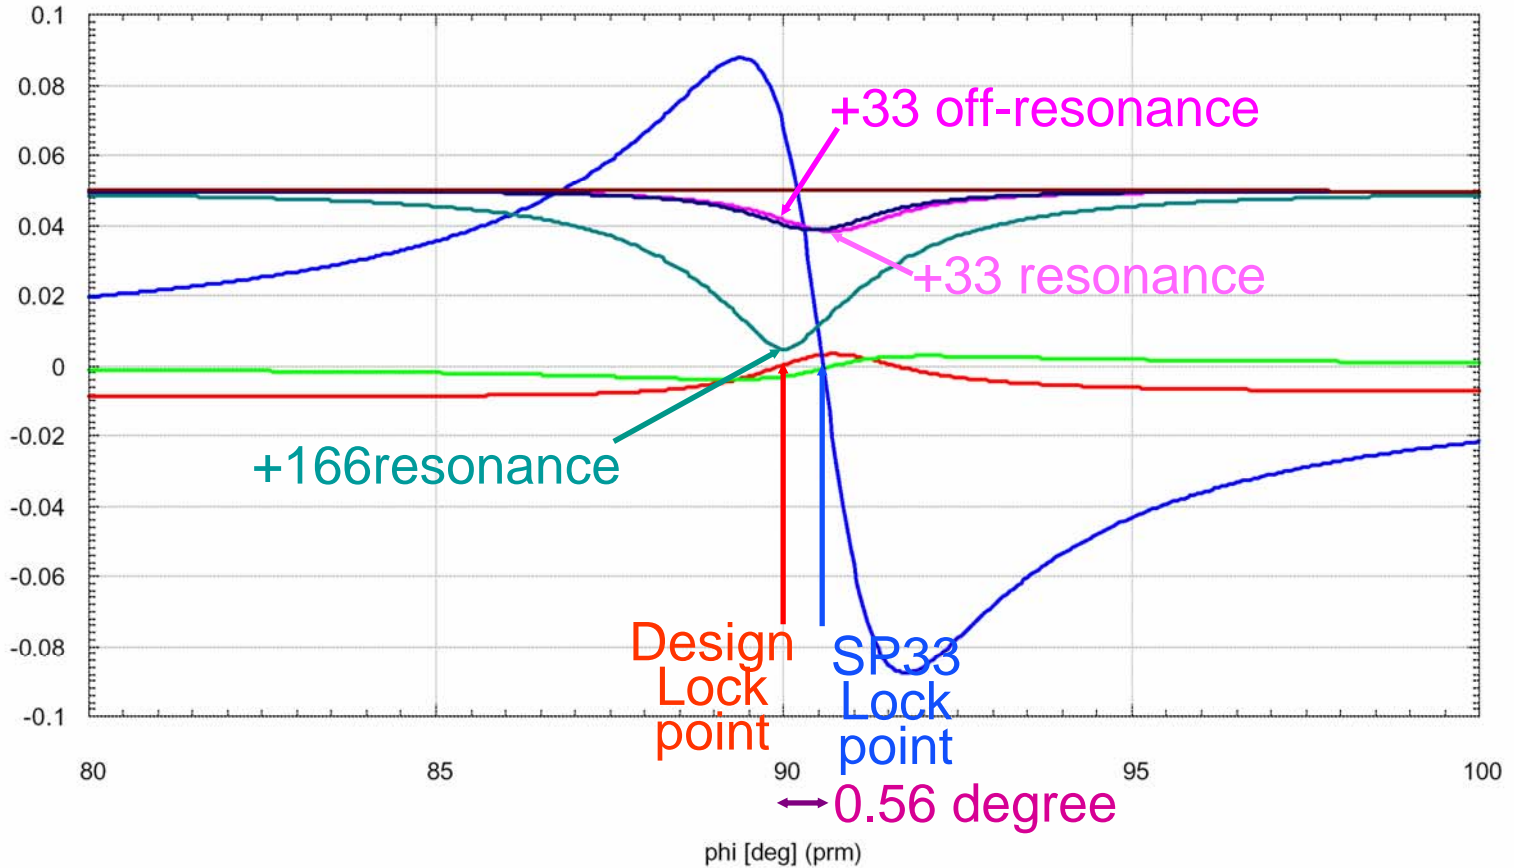

LIGO-G050004-00-R

Setup

1. Signal for I_+ is extracted from Symmetric Port (SP).
2. SP33 is a 33MHz single demodulation PD used for lock acquisition.
3. Then it switches to SP DDM (double demodulation).
4. We assume that I_s and I_- are locked.

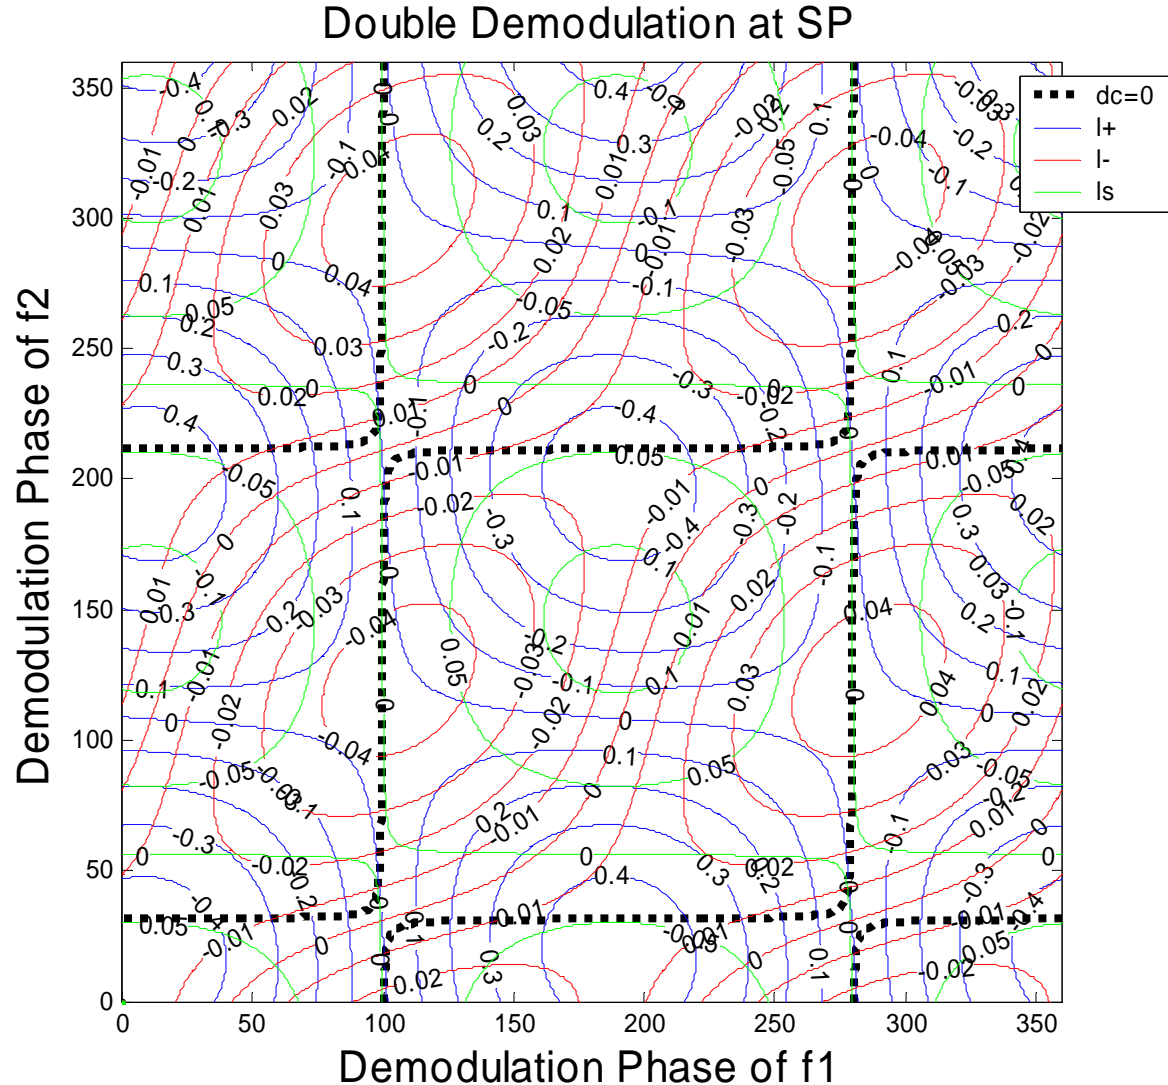

SP33, DDM, +/-33M, +/-166M@SP

Original design (no offset)

- +33 : off-resonant
- 33 : off-resonant
- +166: resonant
- 166 : anti-resonant

- I_+ and I_s plot separated
- Difficult

I_+ +0.56 degree, I_s +0.56 degree

- +33 : resonant
- 33 : resonant
- +166: resonant
- 166 : anti-resonant

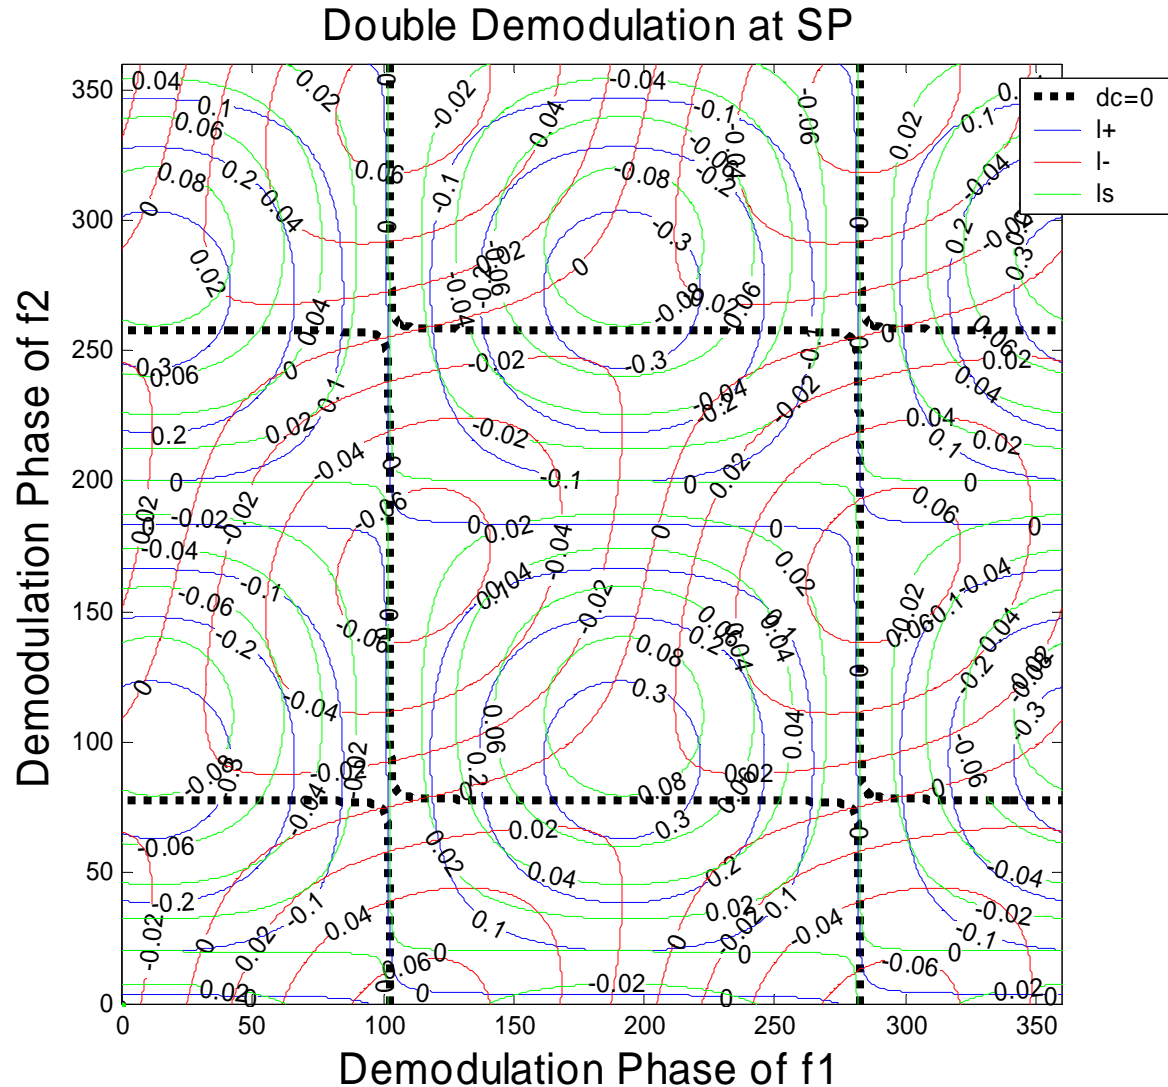

- I_+ and I_s plot overlapping
- DC line changed
- Easy (if I_+ is moved, servo try to move I_s .)

I_+ +0.56 degree

- +33 : resonant
- 33 : resonant
- +166: off-resonant
- 166 : anti-resonant

- I_+ and I_s plot overlapping
- DC line changed
- Difficult

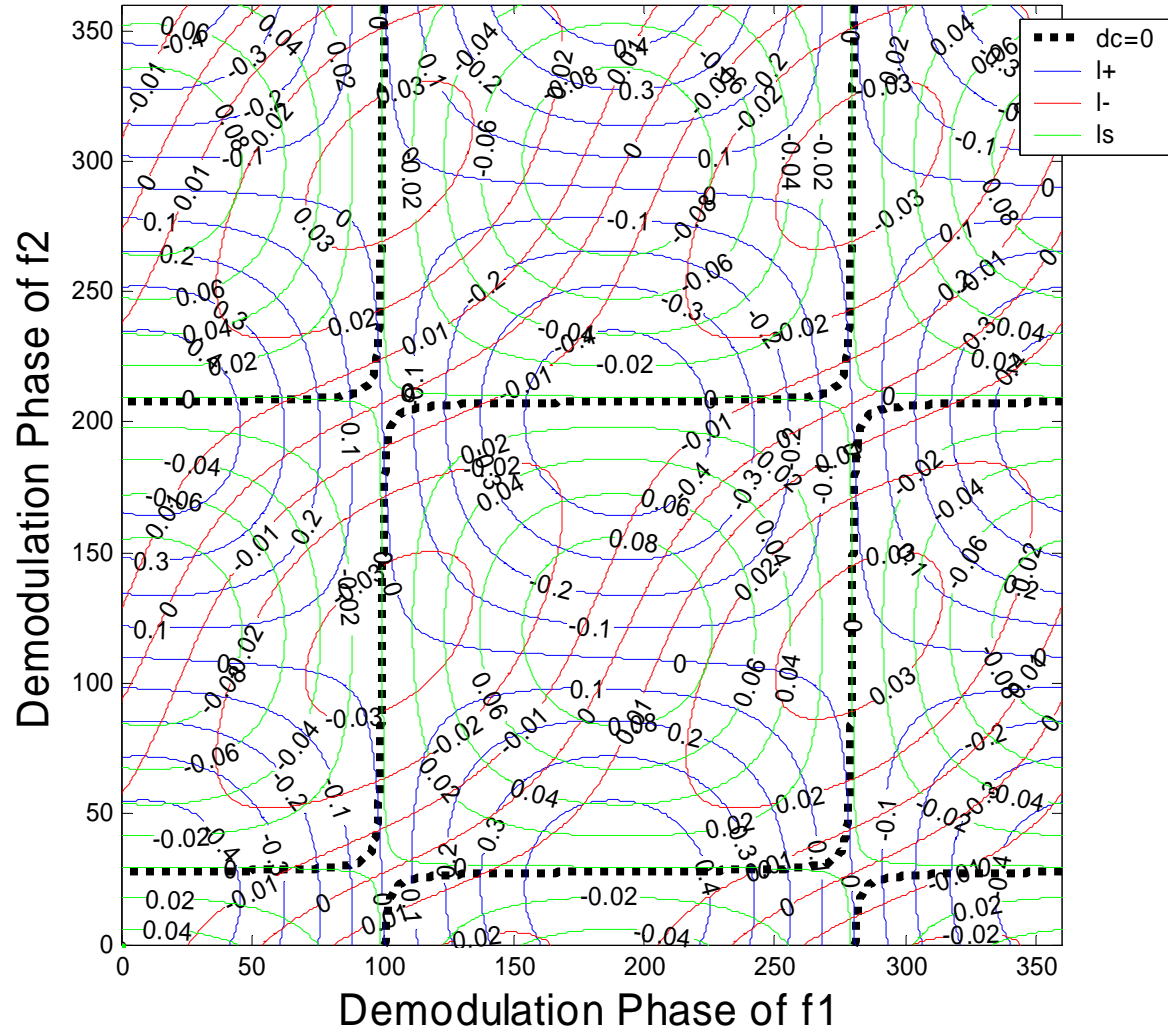

I_s +0.56 degree,

- +33 : off-resonant
- 33 : off-resonant
- +166: resonant
- 166 : anti-resonant

- I_+ and I_s plot separated
- Same DC line
- Difficult

Double Demodulation at SP

Exploring phase

1. Lock I_+ to SP33.
2. Adjust gain during SP33, SP133 and SP199.
3. Find maximum I_+ signal on SP133 and SP199.
4. Move to DC=0 line.
5. Add calculated phase on SP133 and SP199.
6. Add offset on SP33 until SP DDM has no offset.
7. Switch SP33 to DDM.

40m vs. Ad-LIGO

40m

Table 4: Length sensing signals. \otimes means double demodulation.

| Signal | L_+ | L_- | l_+ | l_- | l_s |
|-----------------------|-------------|-------------|--------------|----------------|---------------|
| SP, f_1 | 15.2 | 0.000 | -0.062 | 0.064 | -0.001 |
| AP, f_2 | 0 | 1.69 | 0 | 0.002 | 0 |
| SP, $f_2 - f_1$ | -0.0003 | 0.0001 | 0.214 | 0.029 | 0.039 |
| AP, $f_2 \otimes f_1$ | 0 | 0 | 0.0025 | -0.0034 | -0.0004 |
| PO, $f_2 - f_1$ | 0.005 | -0.004 | 1.000 | -0.277 | -2.980 |

x6

Table 5: Length sensing signals for Advanced LIGO. \otimes means double demodulation. These numbers agree, up to an overall constant, with the table Peter Fritchel showed at the August 2000 LSC meeting (LIGO-G000225).

Ad-LIGO

| Signal | L_+ | L_- | l_+ | l_- | l_s |
|-----------------------|-------------|--------------|-------------|--------------|-------------|
| SP, f_1 | 1890 | 0.00 | -1.94 | 0.11 | 0.00 |
| AP, f_2 | 0 | -1500 | 0 | -1.88 | 0 |
| SP, $f_2 - f_1$ | -0.11 | -0.01 | 19.5 | -0.11 | 8.66 |
| AP, $f_2 \otimes f_1$ | 0.000 | 0.001 | -0.031 | 0.242 | 0.005 |
| PO, $f_2 - f_1$ | -0.42 | -0.01 | 8.84 | 5.81 | 245 |

x2

Summary

- Off-resonance of 33MHz makes good signal separation between I_+ and I_s .
- We can find a way to optimize demodulation phase for DDM at SP, which has good signal separation and no offset.
- Ad-LIGO using 9-180MHz sidebands has less signal separation between I_+ and I_s , but better signal separation for I_- and I_s
