IMPORTANT NOTES:

1. On the Common Mode Servo Tester (D1003364) front panel, all switches must be returned to default positions after each test and/or step, unless otherwise instructed.
2. The default position for most switches is UP, with the exception of switches D22, D25, D28, and D31, which are DOWN.

The switch default positions are shown in Picture 1 below.

Tests Part 3: 4395A Network/Spectrum Analyzer

Connect the 4395A in a similar fashion to the SR785, with a GPIB to Cat5 adapter.

High Frequency Transfer Function (AG4395AHighFreqTF.bat)

Type AG4395AHighFreqTF

Use a network analyzer to measure the transfer function from IN1 to SERVO. Sweep the frequency from 10MHz down to 10kHz with -20dBm source. To remove cable delays first measure the transfer function against a BNC barrel and use as a reference. **Record** the displayed values at 100kHz, 300kHz and 1MHz in the table below. Nominal values are given for CM. See Appendix A3 for typical examples.

** Tolerances are within 1dB and 5deg of nominal.

Frequency	SERVO/IN1 [dB]	Nominal	SERVO/IN1 [deg]	Nominal
100kHz	-30	0dB	167	170deg
300kHz	-30	0dB	146	150deg
1MHz	-31.1	2dB	69.9	75deg
