Library	
Title	LaserLocking
Version	2
TwinCAT version	V2.11.0
Name space	
Author	Sheila Dwyer
Description	Automatic locking for ALS PLL at end station and the squeezer PLL. See following section for more details.
Error Code	<p>0x0001 — Communications error (lost communication from corner PLC1 or cornerPLC2, or there is an error from the timing system)</p> <p>0x0002 — Reference cavity transmission PD error</p> <p>0x0004 — Fiber distribution error</p> <p>0x0008 — Reference cavity transmission below the limit (limit set in this autolocker)</p> <p>0x0010 — Fiber launch PD error (in the fiber distribution box, internal.DC)</p> <p>0x0020 — Fiber launch power below the limit (limit set in by the autolocker)</p> <p>0x0040 — Fiber transmission PD error (the limits are enforced in the DC PD library for the local PDs)</p> <p>0x0080 — Fiber transmission PD limits not set, they need to be set correctly</p> <p>0x0100 — Fiber rejected polarization PD error</p> <p>0x0200 — Fiber rejected PD limits not set</p> <p>0x0400 — % of the fiber light that is in the wrong polarization is too large</p> <p>0x0800 — Power transmitted by fiber in the correct polarization to interfere with ALS laser is too small</p> <p>0x1000 — Laser IR power PD error</p> <p>0x2000 — Laser IR power PD limits not set</p> <p>0x4000 — Locking PD error</p> <p>0x8000 — Locking PD limits not set</p> <p>0x00010000 — Noise eater oscillating</p> <p>0x00020000 — Phase Frequency Discriminator Error</p> <p>0x00040000 — Beat note power too low</p> <p>0x00080000 — Beat note out of range of frequency comparator</p> <p>0x00100000 — Laser Error</p> <p>0x00200000 — Temperature feedback limits reached</p>

	0x00400000 — Laser far above PSL, manually tune 0x00800000 — Laser far below PSL, manually tune 0x01000000 — Was not able to determine if ALS laser is above or below PSL frequency 0x02000000 — Auto Locker Failed, check message
Library Dependencies	ErrorHandler, SaveRestore, ReadADC, WriteDAC, DCPower, Demodulator, ALSLaser, CommonModeServo, TTFSSv4

1 Library Description

This library includes an autolocker for the ALS end station lasers, as well as a function block called temperature controls taken from Alexa Staley's ALSLaser library that implements a slow servo feeding back to the laser crystal temperature.

The use of this library has been extended to lock the squeezer laser. The main difference is that the nominal beat note frequency is twice the VCO frequency, where it is half for the ALS.

It implements the following equation, which results in a 1/f filter if TemperatureControls.PF is zero OR a 1/f response with a zero at Pf, which is intended to compensate for the thermal pole of the laser crystal:

$$u_i = u_{i-1} + g \times \begin{cases} e_i & h \leq 0 \\ (e_i - e_{i-1})/h & h > 0 \end{cases} \text{ with}$$

$$g = \pi f_{\text{ugf}} \Delta t \quad \text{and} \quad h = \pi f_{\text{Pf}} \Delta t.$$

Δt : sampling interval,

f_{ugf} : unity gain frequency of integrator,

f_{Pf} : Knee frequency of proportional gain.

There is also a polarity switch that reverses the sign of the feedback, and an enum (TemperatureControls.ErrorSignal) which allows the user to choose what to use as an error signal: the options are the beat note frequency error measured by the frequency comparator (beat.frequency-beat.vcofrequency/2), the signal sent to the laser PZT calibrated in MHz, or the fast mon from the servo, also calibrated in MHz. There is also a reset that clears the integrator, and range limits for the output of the slow feedback.

The library also includes an error checking function block called locking conditions, which checks for a large number of error conditions that may prevent the PLL from locking, and sets the bit Logic.Conditions to FALSE if any of the locking conditions are not met.

The variable 'locked' is set to true if the common mode servo is not saturated and the beatnote is within tolerance.

A state diagram for the autolocker is below. The user can enable the autolocker so that it will run when the locking conditions are met, or force it so that it will disregard errors from the locking conditions function block. The user can also choose a polarity to lock the ALS laser above or below the PSL in frequency. This sets the polarity on the servo, the phase frequency discriminator, and the temperature feedback.

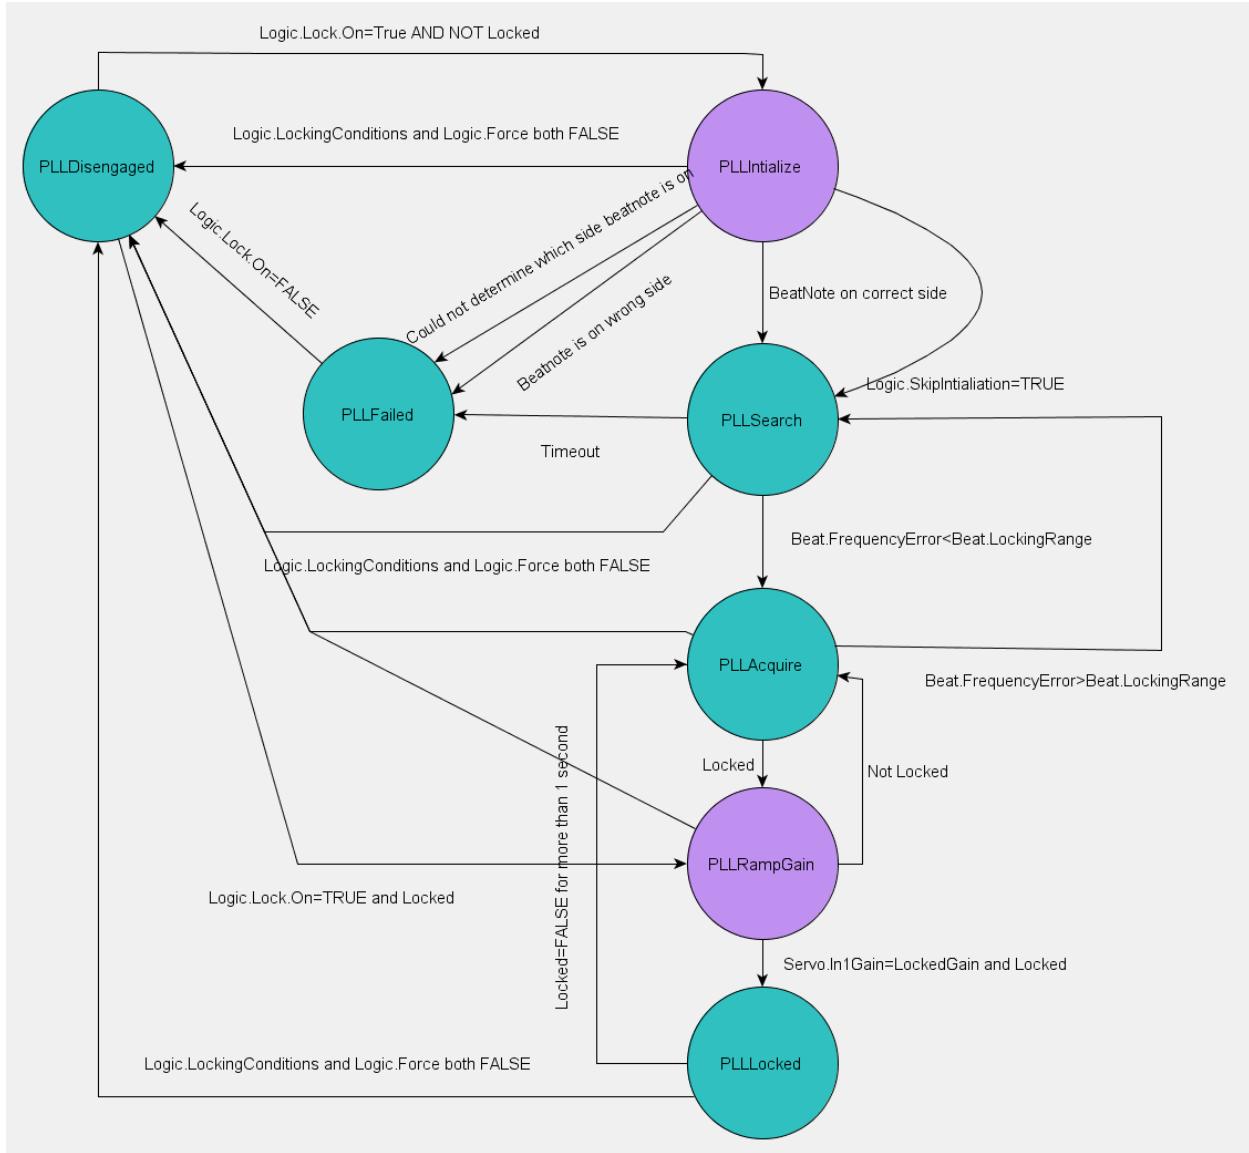

Figure 1: State diagram for PLL autolocking, transitional states in purple

When the autolocker state machine begins running, it either passes to the **PLLInitialize** state, if the PLL is unlocked or to the **PLLGainRamp** state, if it is locked.

The user can choose to skip initialization or to initialize the autolocker, in which case it begins by increasing the laser crystal temperature, waiting 30 seconds and determining based on the response of the beat note measured by the frequency comparator if the laser is above or below the PSL in frequency. If the laser is on the wrong side, or the autolocker cannot determine what side it is on, it goes to the failed state, and the user needs to manually tune the crystal temperature. Once the temperature is manually tuned the user can disengage the autolocker and re-engage it to begin the locking process.

When the laser is on the correct side, the autolocker passes to the **PLLSearch** state, and uses the temperature servo with the beat note measured by the frequency comparator as an error signal, with the common mode board feedback to the PZT disengaged. If the beat note error become less

than beat.LockingRange the state machine passes to PLLacquire, or if 20 minutes pass without the beatnote coming into range the autolocker goes to the PLLfailed state.

In the PLLacquire state the common mode board feedsback to the laser PZT with low gain and the temperature servo continues to use the beatnote error as measured by the frequency comparator as an error signal. If the beat notes goes out of the locking range, the state returns to PLLSearch, if the PLL locks it passes to PLLRampGain.

In PLLRampGain the temperature servo error signal is switched to the PZT feedback, and the input gain of the common mode board is ramped at 1dB per second until it reaches the gain used for locking. If the PLL is locked at the locking gain for 1 second, the state transitions to PLLLocked,

It will stay in the locked state unless the PLL becomes unlocked for more than 1 second, in which case it passes to PLLacquire, or if the locking conditions are no longer met it will pass to disengaged.

2 Example:

```

Comm.CommunicationError := Ifo.Sys.Communication.Y.Error <> 16#03;
Comm.VCOFrequency := RecieveFromCornerPLC1.VCOFrequency;
Comm.BeatFrequency:= RecieveFromCornerPLC1.BeatFrequency;
Comm.SplitMonFrequency:=
    Ifo.ALS.End.Fibr.Servo.SplitMon*(-0.979)*
    EXP(Ifo.ALS.End.Fibr.Servo.FastGain*LN(10)/20)*
    Ifo.ALS.End.Laser.Head.PZTTuningCoefficient;
Comm.CoarseFrequencyCheck := Ifo.ALS.End.Refl.Servo.In1En;
Comm.PZTVoltageInRange:= Abs(Ifo.ALS.End.Fibr.Servo.FastMon) < 9.99;
Comm.RefCavTransError := RecieveFromCornerPLC2.RefCavTransError;
...
AlsEndFibrLockFB (
    LaserType:=LLTypeALS,
    Request:=Request,
    Comm:=Comm,
    LaserLocking := Ifo.ALS.End.Fibr.Lock,
    LaserLockingInit := AlsEndFibrLockInit,
    FiberTrans:=Ifo.ALS.End.Fibr.Trans.Dc,
    FiberRejected:=Ifo.ALS.End.Fibr.Rejected.Dc,
    LaserIR:=Ifo.ALS.End.Laser.Ir.Dc,
    Fiber_A:=Ifo.ALS.End.Fiber_A.Dc,
    ALSLaser:=Ifo.ALS.End.Laser.Head,
    Demod := Ifo.ALS.End.Fibr_A.Demod,
    Servo := Ifo.ALS.End.Fibr.Servo);

```

3 LaserLocking Interface

Laser Type	
TYPE LaserLockingTypeEnum : (LLTypeALS, LLTypeSqueezer)	
END_TYPE;	
Type Name	LaserLockingTypeEnum
Description	Specifies the laser that has to be locked: ALS or Squeezer
Definition	ENUM
Element	Name: LLTypeALS Description: ALS laser
Element	Name: LLTypeSqueezer Description: Squeezer laser

Laser Locking State	
TYPE LaserLockingStateEnum : (PLLDisengaged, PLLInitialize, PLLSearch, PLLAcquire, PLLRampGain, PLLLocked, PLLFailed)	
END_TYPE;	
Type Name	LaserLockingStateEnum
Description	Specifies the state for the PLL
Definition	ENUM
Element	Name: PLLDisengaged Description: The autolocker is disengaged
Element	Name: PLLInitialize Description: Initialize the PLL autolocker
Element	Name: PLLSearch Description: Searching for resonance
Element	Name: PLLAcquire Description: PLL lock is acquired
Element	Name: PLLRampGain Description: Increase the gain of the PLL Common Mode Board
Element	Name: PLLLocked Description: PLL is locked
Element	Name: PLLFailed Description: Autolocker has failed to lock the auxiliary laser

Temperature Servo Error Signal

TYPE TemperatureErrorSignalEnum : (PZTfrequency, BeatNoteError, SplitMon)
END_TYPE;

Type Name	TemperatureErrorSignalEnum
Description	Allows the user to specify what to use as an error signal for the temperature feedback
Definition	ENUM
Element	Name: PZTFrequency Description: Laser PZT actuation
Element	Name: BeatNoteError Description: Difference between the beat note and half the VCO frequency
Element	Name: SplitMon Description: Split mon of the common mode board which can be used when fast feedback is engaged

Laser Locking Servo Request

TYPE LaserLockingServoRequestEnum : (LLServoNoOp, LLservoTurnOff, LLservoTurnOn,
LLservoRampGain);
END_TYPE;

Type Name	LaserLockingServoRequestEnum
Description	Request to the laser locking servo
Definition	ENUM
Element	Name: LLservoNoOp Description: No operation
Element	Name: LLservoTurnOff Description: Turn servo off
Element	Name: LLservoTurnOn Description: Turn servo on in acquire mode
Element	Name: LLservoTurnRampGain Description: Ramp servo gain up and engage boosts

Laser Locking Servo State

TYPE LaserLockingServoStateEnum : (LLServoInactive, LLServoBusy, LLServoFail);
END_TYPE

Type Name	LaserLockingServoStateEnum
Description	State of the laser locking servo
Definition	ENUM
Element	Name: LLServoInactive Description: No operation
Element	Name: LLServoBusy Description: Servo locking logic is busy
Element	Name: LLServoFail Description: Servo locking logic has failed

Laser Locking Servo State

TYPE LaserLockingTtFssRequestEnum : (LLTtFssNoOp, LLTtFssFastBoostWait, LLTtFssLockWait,
LLTtFssFastFilterWait, LLTtFssEomWait, LLTtFssComBoostWait);
END_TYPE

Type Name	LaserLockingTtFssRequestEnum
Description	Internal state of the servo locking logic
Definition	ENUM
Element	Name: LLTtFssNoOp Description: No operation
Element	Name: LLTtFssFastBoostWait Description: Wait before engaging the fast boost
Element	Name: LLTtFssLockWait Description: Wait for the servo to lock properly
Element	Name: LLTtFssFastFilterWait Description: Wait before engaging the fast filter
Element	Name: LLTtFssEomWait Description: Wait before engaging the eom path
Element	Name: LLTtFssComBoostWait Description: Wait before engaging the common boost

User Interface Type

TYPE LaserLockingStatusStruct:

STRUCT

Message:	STRING;
Locked:	BOOL;
LockLosses:	INT;
ResetLockLosses:	BOOL;

END_STRUCT;

END_TYPE;

Type Name	LaserLockingStatusStruct
Description	Structure used to represent status of laser locking
Definition	STRUCT
Output Tag	Name: Message Type: STRING Description: Message for operator
Output Tag	Name: Locked Type: BOOL Description: PLL is locked
Output Tag	Name: LockLosses Type: INT Description: Counts the number of times lock has been lost
Input Tag	Name: ResetLockLosses Type: BOOL Description: Resets the lock loss counter

Auxiliary Interface Type

TYPE LaserLockingRefCavStruct :

STRUCT

TransLim: LREAL;

END_STRUCT;

END_TYPE;

Type Name	LaserLockingRefCavStruct
Description	Structure used in the user interface type to check the reference cavity
Definition	STRUCT
Input Tag	Name: LaunchLim Type: LREAL Description: Lower limit for launched fiber power

Auxiliary Interface Type

```
TYPE LaserLockingFiberStruct :
```

```
STRUCT

```

```
END_TYPE;
```

Type Name	LaserLockingTtFssFB
Description	Function block for the autolocker using a TTFSS V4 servo. Extends the functionality of the LaserLocking FB by adding the specific locking controls for a TTFSS servo. The two parameters ServoRequest and ServoBusy have been dropped, but a parameter for the servo controls has been added.
Definition	Function Block
In/Out Argument	Name: Servo Type: TtFssV4Struct Description: Controls for the servo board

5 Auxiliary Functions

Function Block

```

TYPE LockingConditionsFB :
VAR_INPUT
    CommunicationsError: ErrorStruct;
    Demod: DemodulatorLscStruct;
    FromCornerPLC2: CornerPLC2toEndStruct;
    FiberTrans: DCPowerStruct;
    FiberRejected: DCPowerStruct;
    LaserIR: DCPowerStruct;
    Fibr_A: DCPowerStruct;
    Servo: CommonModeStruct;
    Laser: ALSLaserStruct;
END_VAR;
VAR_IN_OUT
    ErrorHandler: ErrorHandlerFB;
    ALSLaserLocking: ALSLaserLockingStruct;
END_VAR;
END_TYPE;

```

Type Name	LockingConditionsFB
Description	Function block for the conditions of the autolocker
Definition	Function Block
Input Argument	Name: CommunicationsError Type: ErrorStruct Description: Checks for a communications error
Input Argument	Name: Demod Type: DemodulatorLscStruct Description: User interface structure
Input Argument	Name: FromCornerPLC2 Type: CornerPLC2toEndStruct Description: Communication between corner PLC2 and end station
Input Argument	Name: FiberTrans Type: DCPowerStruct Description: PD monitoring total fiber transmission power
Input Argument	Name: FiberRejected Type: DCPower Struct Description: PD monitoring total fiber rejected power
Input Argument	Name: LaserIR Type: DCPowerStruct Description: PD monitoring the ALS laser power in IR path

Input Argument	Name: Fibr_A Type: DCPowerStruct Description: DC output of broad band PD
Input Argument	Name: Servo Type: CommonModeStruct Description: User interface structure
Input Argument	Name: Laser Type: ALSLaserStruct Description: User interface structure
In/Out Argument	Name: ALSLaserLocking Type: ALSLaserLockingStruct Description: User interface structure
In/Out Argument	Name: ErrorHandler Type: ErrorHandlerFB Description: Calls error handler FB
