## 1 Introduction

The tests described below will be utilized to test the A-Plus LIGO HAM-A Coil Driver (with pcb D1100117-v4). These boards will be used to drive the HDS and Tip Tilts Suspension Coil Drivers mirrors of the A-Plus IFOs. The design requirements for the driver can be found in LIGO document number T0900495-v4, "HAM Auxiliary Suspensions Electronics Requirements", also for related documents please see E2000182, E1201027, E1201036, D1100687 and T1200264.

## 2 Test Equipment

- Stanford Research SR785 analyzer
- Voltmeter
- Oscilloscope
- Board Schematics- TBD

## 3 Tests

### 3.1 Quiescent Current draw and Continuity Test

Measure each internal power supply current and record the results in the next table.

| Power Rail <br> Supply (v) | $\begin{gathered} \text { Quiescent } \\ \text { Current (mA) } \end{gathered}$ | LED's ON |  |  |  | $\begin{gathered} \text { Measured } \\ \text { Value } \\ (m A) \end{gathered}$ | Pass | Fail |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | $\begin{aligned} & \hline+\mathbf{1 4 v} \\ & \text { Front } \\ & \text { Panel } \end{aligned}$ | $\begin{gathered} \hline-14 \mathrm{v} \\ \text { Front } \\ \text { Panel } \end{gathered}$ | $\begin{aligned} & \hline+\mathbf{1 8 v} \\ & \text { Front } \\ & \text { Panel } \end{aligned}$ | $\begin{gathered} -18 v \\ \text { Front } \\ \text { Panel } \end{gathered}$ |  |  |  |
| $\pm 18 \mathrm{~V}$ Supply | $+230 \pm 50,-190 \pm 50$ |  |  | Y | Y | +234/-192 | Pass |  |
| $\pm 14 \mathrm{~V}$ Supply | $+86 \pm 10,-86 \pm 10$ | Y | Y |  |  | +85/-85 | Pass |  |

Verify Photodiode connection path from D1100117-v4 by performing a continuity test from connector $\mathrm{J} 1(\mathrm{~dB} 9 \mathrm{~F})$ to connector $\mathrm{J} 2(\mathrm{~dB} 25 \mathrm{~F})$.

| Coil <br> Channel | Test <br> Point |  | Predicted <br> Continuity <br> $(\mathbf{\Omega})$ | Measured <br> Continuity <br> $(\mathbf{\Omega})$ | Pass | Fail |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\mathbf{J 1}$ | $\mathbf{J 2}$ | ( |  |  |  |
| PD1P | $\mathbf{1}$ | $\mathbf{1}$ | $\mathbf{0 . 5} \pm \mathbf{0 . 2}$ | 0.40 | Pass |  |
| PD1N | $\mathbf{6}$ | $\mathbf{1 4}$ | $\mathbf{0 . 5} \pm \mathbf{0 . 2}$ | 0.50 | Pass |  |
| PD2P | $\mathbf{2}$ | $\mathbf{2}$ | $\mathbf{0 . 5} \pm \mathbf{0 . 2}$ | 0.46 | Pass |  |
| PD2N | $\mathbf{7}$ | $\mathbf{1 5}$ | $\mathbf{0 . 5} \pm \mathbf{0 . 2}$ | 0.55 | Pass |  |
| PD3P | $\mathbf{3}$ | $\mathbf{3}$ | $\mathbf{0 . 5} \pm \mathbf{0 . 2}$ | 0.51 | Pass |  |
| PD3N | $\mathbf{8}$ | $\mathbf{1 6}$ | $\mathbf{0 . 5} \pm \mathbf{0 . 2}$ | 0.55 | Pass |  |
| PD4P | $\mathbf{4}$ | $\mathbf{4}$ | $\mathbf{0 . 5} \pm \mathbf{0 . 2}$ | 0.45 | Pass |  |
| PD4N | $\mathbf{9}$ | $\mathbf{1 7}$ | $\mathbf{0 . 5} \pm \mathbf{0 . 2}$ | 0.51 | Pass |  |

### 3.2 Input Enable Relay Operation

In this section the operation of the input relay (K1) will be tested. If this relay is not energized, the inputs to each coil driver channel are tied to circuit ground. The operation is tested using the jumpers on the board (P4). Each channel can be controlled separately and has an LED indicator. There is also an external monitor signal that can be used by the control system to verify the position of this relay. Operation of this monitor signal will also be verified. The test is performed by connecting a 1 KHz $1 \mathrm{Vp}-\mathrm{p}$ sine wave to each input and verifying that the signal only propagates to the output when the
$\qquad$ Date: _19/12/20 $\qquad$
Tech: $\qquad$ Steve Hateley $\qquad$ T1100084-v5, Page 3
relay is energized using the appropriate jumper. In the table below record the results of the tests for each channel.

| Channel | Channel Enable <br> Monitor Signal <br> Pins <br> (Pin 5is return) | Relay NOT Energized- <br> Signal not at Output <br> and LED OFF and J9 <br> monitor HIGH? | Relay Energized- Signal <br> at Output and LED ON <br> And J9 Monitor LOW? | Pass | Fail |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | J9- 6, 5 | Yes | Yes | Pass |  |
| 2 | J9- 7,5 | Yes | Yes | Pass |  |
| 3 | J9- 8,5 | Yes | Yes | Pass |  |
| 4 | J9- 9,5 | Yes | Yes | Pass |  |

The jumpers used to energize each of the input relays in this section should be left in for the remainder of the testing.

### 3.3 Transfer Function Tests

The transfer function for each mode of operation is measured by injecting a signal into the input of a channel and measuring the current through a 20 -ohm resistor connected across the corresponding channel output. Measurements are made for frequencies from 0.1 Hz to 10 KHz . A block diagram of the test setup is shown in the figure below.

### 3.3.1 Straight Through Mode

In the straight through mode, relay K2 is NOT energized. The nominal response of the coil driver in this mode essentially flat and is shown in the plot below. Note that the transfer function is in units of volts in to amps output into a 20 -ohm load, so if the transfer function is measured by measuring the voltage across the load resistor 26 dB must be subtracted from the measurement to convert to $\mathrm{dBA} / \mathrm{V}$. Gain is adjusted with factor 2 (for differential driver between the DSA and Driver Inputs, subtract 6 dB ).

Figure 1: Straight Through Mode Transfer Function
$\qquad$ Date: _19/12/20 $\qquad$
Tech: $\qquad$ Steve Hateley $\qquad$ T1100084-v5, Page 4
In the tables below, record the measured magnitude and phase of the response for each channel. In addition, save the transfer function for one representative channel to disk and record the file name in space provided below. Gains should be $+/-1 \mathrm{~dB}$ and phases should be $+/-4$ degrees for all measurements. Also record that the LED showing that the channel is in Straight-through mode is NOT illuminated and that the remote indicator provided on connector J9 LOW. Note that J9 pin 5 is the return for all indicators on J 9 .

Table 1: Channel 1 Transfer Function Measurements

| Freq <br> $(\mathbf{H z})$ | Nominal Gain <br> (dBamps/Volt) | Nominal <br> Phase <br> (Degrees) | Actual Gain <br> (dBamps/Volt) | Actual <br> Phase <br> (Degrees) | LED <br> OFF? | J9- 1, 5 <br> LOW? | Pass | Fail |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

### 3.3.2 Filtered Mode

In the Filtered mode, relay K2 is energized using on board jumpers on P3. The nominal response of the coil driver in Filtered mode is poles at 1 Hz and 200 Hz , and zeros at 10 Hz and 20 Hz and is shown in the plot below. Note that the transfer function is in units of volts in to amps output into a 20 -ohm load, so if the transfer function is measured by measuring the voltage across the load resistor 26 dB must be subtracted from the measurement to convert to dBA/V. Gain is adjusted with factor 2 (for differential driver between the DSA and Driver Inputs, subtract 6dB).

Figure 2: Filtered Mode Transfer Function
In the tables below, record the measured magnitude and phase of the response for each channel. In addition, save the transfer function for one representative channel to disk and record the file name in space provided below. Also record that the LED showing that the channel is in Filtered mode is illuminated and that the remote indicator provided on connector J9 HIGH. Note that J9 pin 5 is the return for all indicators on J 9 .

Table 5: Channel 1 Transfer Function Measurements

### 3.3.3 Dynamic Range Tests

The dynamic range requirement for the A-Plus HAM-A Driver is 3.5 mA peak for frequency $<1 \mathrm{KHz}$. The tests below will verify that the design meets this requirement. In addition, the board components will be checked for overheating. The tests for all channels should be conducted simultaneously and each test step/reading should be held for a minimum of 5 minutes to allow the temperature of the chassis and components to stabilize. In the tables below, record the output current versus input voltage (both peak), note any component heating and if possible the temperature of the component. Output current should be measured across the 20 -ohm load resistor connected to the channel under test. The input signal used for this should be a 1 KHz sine wave. The driver board should be in the Straight Through mode configuration used in section 3.3.1 of this test plan.

### 3.4 Noise Tests

The simulation of current noise from A-Plus LIGO HAM-A Driver, document E1900347, shows that at 10 Hz we will see $194 \mathrm{pA} / \sqrt{ } \mathrm{Hz}$ (with 1 K 2 output resistors 20R load) at the coil (Incl DAC noise). The noise of the driver alone is significantly lower. It is very difficult to measure noise currents of this magnitude, so the output voltage noise of the driver will be measured using TP3 and TP7 (ie before the output resistors). The output noise of the driver across these points should be $33 \pm 10 \mathrm{nV} / \sqrt{ } \mathrm{Hz}$ at 10 Hz (in Filtered Mode).

Table 13: Noise Test Results

| Channel <br> Number | Measure <br> Pin | Predicted <br> Noise at <br> $\mathbf{1 0 H z}$ <br> $(\mathbf{n V} / \sqrt{\mathbf{H z})}$ | Measured <br> Noise at <br> $\mathbf{1 0 H z}$ <br> $(\mathbf{n V} / \sqrt{\mathbf{H z})}$ | Pass | Fail |
| :---: | :---: | :---: | :---: | :---: | :---: |

## Release Notes

V3 to 4 Clarified limits for Supply currents. Widened tolerance on Filter mode Tx function phase (to 4Deg). Clarified Tx function test setup block diagram in sec 3.3.
V4 to 5 Clarified test limits and mode of operation for noise tests (filter mode). Added new table to record noise in straight thro mode for reference.
